

Easy-to-Manage Data Protection with
Wave Cloud

wave[®]

What is Wave Cloud?

Wave Cloud is an endpoint encryption management service. Through a single, intuitive web console, IT can easily and remotely set up and manage self-encrypting drives (SEDs) or OS-native encryption features such as Windows BitLocker or OSX FileVault – or even a combination of the three. **Wave Cloud** can securely and simply manage your deployment and ensure you are compliant with data protection regulations.

**Endpoint encryption + Wave Cloud =
easy, fully-managed data protection**

Which endpoint encryption is right for you?

Wave Cloud gives you the flexibility to choose the endpoint encryption tool that's right for your organization. Organizations are increasingly choosing to protect their endpoint data with SEDs because of the advantages in user experience, deployment costs, and increased security that come with hardware-embedded encryption. For those not yet ready to deploy SEDs, **Wave Cloud** also manages OS-native encryption tools such as Microsoft BitLocker and iOS FileVault2. Some organizations choose to introduce SEDs in the course of a normal PC refresh cycle, in which case deploying BitLocker or FileVault in the interim is recommended for short-term data protection. **Wave Cloud** makes the transition seamless by managing all these options, in any combination.

Benefits of Wave Cloud

- ▶ **Lower TCO than an on-premise solution**
- ▶ **Easy, fully-managed encryption**
- ▶ **Always up-to-date**
- ▶ **Scalable to meet the needs of large enterprises**
- ▶ **Provable compliance**
- ▶ **Fast deployment**

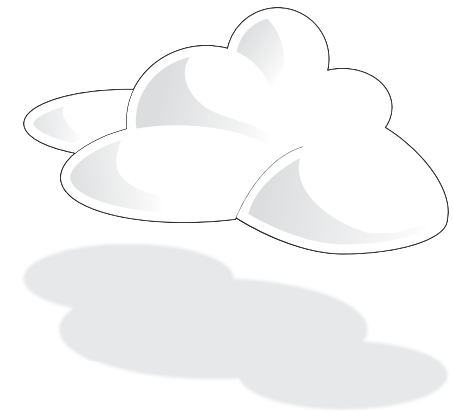

What sets Wave Cloud apart from other data protection solutions?

Not every organization has (or wants) on-site servers. For those looking to deploy fast, cost-effective, hardware-secured encryption, **Wave Cloud** makes it possible to achieve enterprise-grade management and compliance without the cost of maintaining on-site servers.

Because you are only paying for what you use – without the investment in on-site infrastructure – **Wave Cloud** requires minimal capital expenditure. And the fact that it allows you to integrate deployment into a typical refresh cycle (SEDs are available from all major drive manufacturers at a similar cost to non-encrypted drives) means even less up-front expense. Add to that the fact that **Wave Cloud** is always up-to-date and doesn't require constant software upgrades, and you have truly great ROI.

If you're wondering how **Wave Cloud** stacks up against the competition, the answer is that there isn't any. It's the only web-based management service of its kind – no other cloud-based service can manage SEDs.
